How do I troubleshoot rotary screw compressors?

Troubleshooting rotary screw compressors doesn't have to be overwhelming. By identifying common issues like insufficient air pressure, oil carryover, or high energy consumption, and taking proactive steps to address them, you can keep your system running smoothly and efficiently.

Why is my rotary screw compressor overheating?

Solving insufficient air pressure is critical for maintaining productivity and avoiding further system stress. When a rotary screw compressor begins overheating, it's a clear sign that something is amiss. High operating temperatures can lead to inefficiencies, system shutdowns, and even long-term damage to critical components.

What happens if a rotary screw compressor uses too much oil?

Excessive oil consumption in a rotary screw compressor is more than just a minor inconvenience--it's a costly issue that can impact the efficiency and lifespan of your system. When a compressor uses more oil than expected, it's essential to identify and address the root cause to avoid escalating operational costs and potential downtime.

Why do rotary screw compressors make noise?

By addressing excessive oil consumption promptly, you can save on operating costs and ensure your compressor performs at its best. Rotary screw compressors are known for their smooth and quiet operation, so when you hear unusual noises or feel excessive vibrations, it's a sign that something isn't right.

Why does my compressor trip on over temperature?

If your compressor trips on over temperature, it could be any of the following: Ambient temperature too high or not enough ventilation. A screw compressor can run loaded ('pumping air') or unloaded ('idle'). The inlet/loading valve opens and closes according to air demand.

Why is my air compressor not working?

Another frequent cause is blocked or dirty air filters. Filters are essential for keeping contaminants out of your system, but if they're clogged, they can restrict airflow and prevent your compressor from achieving the desired pressure. Finally, faulty pressure regulators or valves may be to blame.
